Introduction

Introduction :-

A patient may visit multiple doctors, clinics, laboratories and hospitals over time. Medical information such as prescriptions, diagnoses, allergies and laboratory reports can become scattered across different places.
This can make it difficult for a doctor to quickly understand the patient's previous medical history.

Proposed idea:-

CityCare is a patient-controlled healthcare platform that organizes medical records into a longitudinal timeline and allows patients to selectively share relevant records with doctors using time-limited consent.

Literature Survey

Sr. No.-	Paper Title and its Author	Details of Publication	Findings
1	Personal Health Records: A Systematic Literature Review ~Jürgen Hoerbst, Elske Ammenwerth	International Journal of Medical Informatics, 2017	Reviews existing Personal Health Record systems and their functions
2	Patient and Public Willingness to Share Personal Health Data for Third-Party or Secondary Uses: Systematic Review ~Rebecca Baines, Sebastian Stevens, Daniela Austin, Krithika Anil, Hannah Bradwell	Journal of Medical Internet Research, Vol. 26, 2024	The review found that people value control over what data is shared, with whom, when and for how long.
3	Factors that affect the use of electronic personal health records among patients: A systematic review ~Shima Mollart, et al	International Journal of Medical Informatics, Vol. 126, 2019, pp. 164–175	It say that simply developing an ePHR is not enough; usability, perceived usefulness and other adoption factors affect whether patients actually use it.

Problem Statement

Problem & it’s justification:-

Patients often have medical records distributed across different healthcare providers and personal documents. When consulting a new doctor, previous diagnoses, medications, allergies and laboratory reports may not be readily organized or available. Reviewing multiple documents manually can also consume time. Therefore, there is a need for a patient-controlled platform that organizes medical history and enables secure, consent-based sharing of relevant information with healthcare professionals and to also help them to find and appoint the health professional.

Justifications for Selecting the Title

Justifications:-

- Why CityCare?

- 1. Real-world relevance
- Patients frequently maintain medical information across multiple sources.

- 2. Patient-centric approach
- The patient controls which information is shared.

- 3. Technical scope
- The project combines web development, database management, security, OCR and AI.

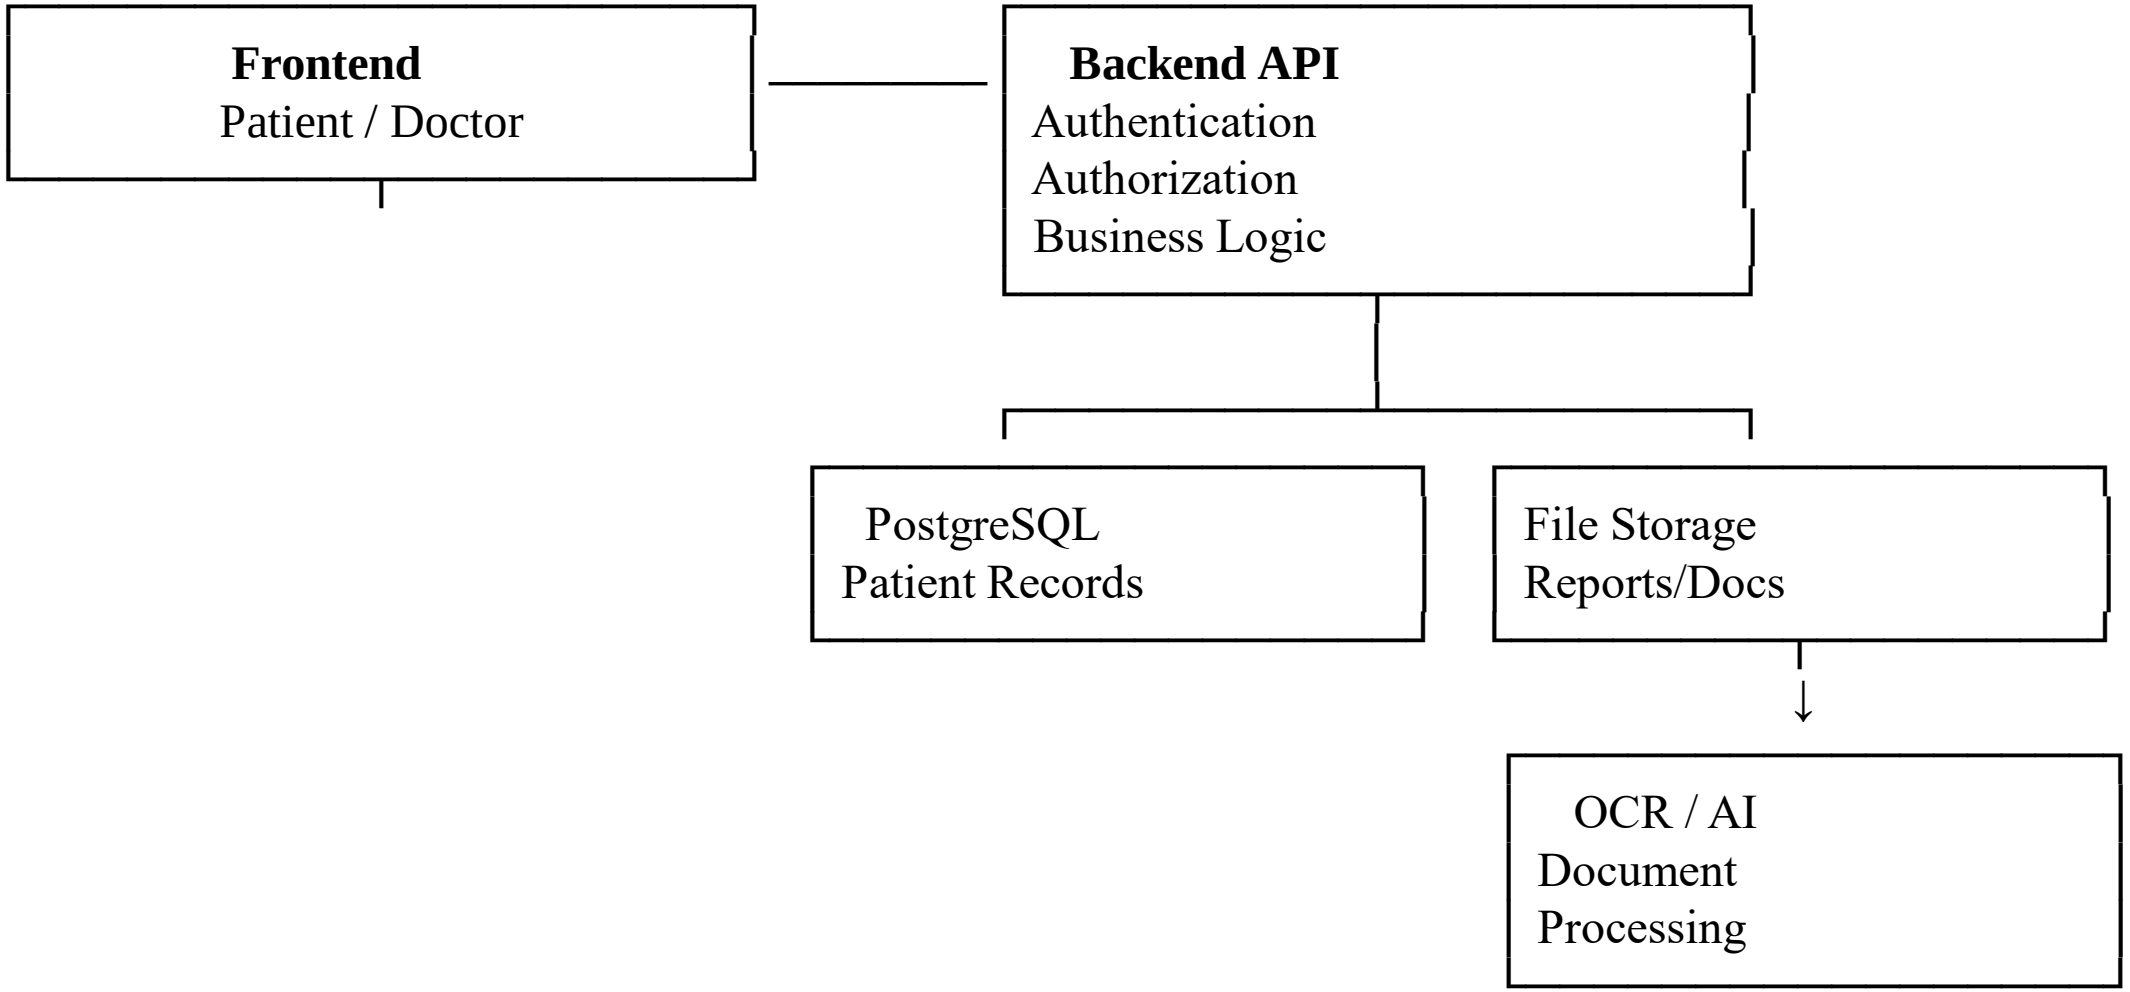

- 4. Future scalability
- The architecture can later support healthcare interoperability standards.

Objectives of the Project

Objective of the Project:-

- To develop a centralized platform for organizing a patient's medical history.
- To provide a chronological timeline of diagnoses, medications, allergies, laboratory results and encounters.
- To implement consent-based and time-limited sharing of medical records with doctors.
- To use OCR and AI to assist in extracting and summarizing information from uploaded medical documents.
- To maintain an audit trail of access to patient information.

Block Diagram

Expected Result

Expected Results:-

By the completion of the project, CityCare is expected to provide:

A centralized patient health record.

Chronological medical timeline.

Appointment booking with doctors.

Consent-based record sharing.

Access monitoring through audit logs.

OCR-assisted document processing.

AI-generated medical record summaries for doctor review.

Secure role-based access for patients and doctors.

Work – Plan

Months Activities	SEPT'26	OCT'26	NOV'26	DEC'26	
Literature Reviews	√				
Component Identification & Selection	√				
Designing					
Fabrication					
Experimental Analysis					
Testing and Debugging					
Preparation of Project Report					
Thesis and Poster Submission
